

ECE 50024

Homework 1

Parth Sagar Hasabnis

phasabni@purdue.edu

Exercise 1:

Mean of the distribution is: 0.026005414594233493.

Standard Deviation of the distribution is: 0.9907009680534483.

Exercise 1

b) v) The histogram with 4 bins does not represent the data very well, as the number of bins is too less. It does not provide adequate information about the mean or the variance of the data.

Likewise, 1000 is far too many bins for the given data. Even though we can obtain some information about the mean and variance, the plot appears to be noisy, and a trend in the data is not discernable

Optimal number of bins = 15

Exercise 2:

a)

$$f_X(x) = \frac{1}{\sqrt{(2\pi)^2 |\Sigma|}} \exp \left\{ -\frac{1}{2} (x-\mu)^T \Sigma^{-1} (x-\mu) \right\}$$

$$X = \begin{bmatrix} X_1 \\ X_2 \end{bmatrix} \quad x = \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} \quad \mu = \begin{bmatrix} 2 \\ 6 \end{bmatrix} \quad \Sigma = \begin{bmatrix} 2 & 1 \\ 1 & 2 \end{bmatrix}$$

$$|\Sigma| = 3 \quad \Sigma^{-1} = \frac{1}{3} \begin{bmatrix} 2 & -1 \\ -1 & 2 \end{bmatrix}$$

$$\therefore (x-\mu)^T \Sigma^{-1} (x-\mu)$$

$$= [x_1 - 2 \quad x_2 - 6] \times \frac{1}{3} \begin{bmatrix} 2 & -1 \\ -1 & 2 \end{bmatrix} \begin{bmatrix} x_1 - 2 \\ x_2 - 6 \end{bmatrix}$$

$$= \frac{1}{3} [2(x_1 - 2) - 1(x_2 - 6) \quad -1(x_1 - 2) + 2(x_2 - 6)] \begin{bmatrix} x_1 - 2 \\ x_2 - 6 \end{bmatrix}$$

$$= \frac{-2}{3} [(x_1 - 2)(x_2 - 6) - (x_1 - 2)^2 - (x_2 - 6)^2]$$

$$= \frac{-2}{3} [-x_1^2 - x_2^2 + x_1 x_2 - 2x_1 + 16x_2 - 28]$$

$$f_X(x) = \frac{1}{\sqrt{(2\pi)^2 3}}$$

$$f_X(x) = \frac{1}{\sqrt{3(2\pi)^2}} \exp \left\{ \frac{1}{3} \begin{bmatrix} -x_1^2 - x_2^2 + x_1 x_2 \\ -2x_1 + 10x_2 - 28 \end{bmatrix} \right\}$$

b)

b) ii) $X \sim N(0, I)$ $\therefore \mu_x = \vec{0}$
 $\Sigma_x = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$

$$Y = Ax + b$$

$$\begin{aligned} \therefore E[Y_n] &= E\left[\sum_{k=1}^N a_{nk} X_k + b_n\right] \\ &= \sum_{k=1}^N a_{nk} E[X_k] + b_n \end{aligned}$$

$$\therefore \mu_y = \begin{bmatrix} E[Y_1] \\ E[Y_2] \\ \vdots \\ E[Y_N] \end{bmatrix} = \begin{bmatrix} \sum_{k=1}^N a_{1k} E[X_k] + b_1 \\ \sum_{k=1}^N a_{2k} E[X_k] + b_2 \\ \vdots \\ \sum_{k=1}^N a_{Nk} E[X_k] + b_N \end{bmatrix}$$

$$= \begin{bmatrix} a_{11} & a_{12} & \cdots & a_{1N} \\ a_{21} & a_{22} & \cdots & a_{2N} \\ \vdots & \vdots & \ddots & \vdots \\ a_{N1} & a_{N2} & \cdots & a_{NN} \end{bmatrix} \begin{bmatrix} E[X_1] \\ E[X_2] \\ \vdots \\ E[X_N] \end{bmatrix} + \begin{bmatrix} b_1 \\ b_2 \\ \vdots \\ b_N \end{bmatrix}$$

$$= A\vec{0} + b$$
$$\mu_y = b$$

$$\begin{aligned}
 \Sigma_y &= I\mathbb{E} \left[(\gamma - \mu_y)(\gamma - \mu_y)^T \right] \\
 &= I\mathbb{E} \left[(Ax + b - b)(Ax + b - b)^T \right] \\
 &= I\mathbb{E} \left[(Ax)(Ax)^T \right] \\
 &= I\mathbb{E} \left[Ax x^T A^T \right] \\
 &= A \mathbb{E} \left[x x^T \right] A^T
 \end{aligned}$$

$$As \quad \mu_x = 0 \quad \mathbb{E} \left[x x^T \right]$$

$$\begin{aligned}
 &= I\mathbb{E} \left[(x - \mu_x)(x - \mu_x)^T \right] \\
 &= \Sigma_x
 \end{aligned}$$

$$\therefore \Sigma_y = A \Sigma_x A^T$$

ii) Consider an element $\Sigma_{i,j}$ of Σ_y

$$\Sigma_{i,j} = \text{Cov}(y_i, y_j), \Sigma_{j,i} = \text{Cov}(y_j, y_i)$$

As covariance is commutative

$$\text{Cov}(y_i, y_j) = \text{Cov}(y_j, y_i)$$

$$\therefore \Sigma_{i,j} = \Sigma_{j,i}$$

$\therefore \Sigma_y$ is a symmetric matrix

For a matrix to be positive semi-definite,

$$v^T \Sigma_y v \geq 0 \quad \forall v \in \mathbb{R}^n$$

$$v^T \Sigma_y v = v^T A E [$$

$$\begin{aligned} v^T \Sigma_y v &= v^T A A^T v \\ &= (v^T A)(v^T A)^T \\ &= (v^T A) \cdot (v^T A) \\ &= \|v^T A\|_2 \end{aligned}$$

\therefore The L_2 norm of a matrix is always greater than or equal to 0.

$\therefore \Sigma_y$ is a symmetric positive semi-definite matrix

iii) For Σ_y to be positive definite:

$$v^T \Sigma_y v > 0 \quad \forall v \in \mathbb{R}^n - \{\vec{0}_{n \times 1}\}$$

$$\therefore v^T \Sigma_y v = 0 \text{ implies } v = \vec{0}_{n \times 1}$$

$$\therefore v^T (AA^T)v = 0$$

$$(v^T A)(A^T v) = 0$$

$$(v^T A)(v^T A)^T = 0$$

$$(v^T A) \cdot (v^T A) = 0$$

$$\|v^T A\|_2 = 0, \quad v^T$$

For the L₂ norm of $v^T A$ to be zero
when $v = \vec{0}$, A needs to have full rank

\therefore For Σ_y to be positive definite,
A needs to have full rank, which implies
that A needs to be invertible

$$Y \sim N(\mu_Y, \Sigma_Y)$$

$$\mu_Y = \begin{bmatrix} 2 \\ 6 \end{bmatrix} \quad \Sigma_Y = \begin{bmatrix} 2 & 1 \\ 1 & 2 \end{bmatrix}$$

$$Y = Ax + b \quad X \sim N(0, I)$$

We know that $\mu_Y = b$:

$$\therefore b = \begin{bmatrix} 2 \\ 6 \end{bmatrix}$$

Consider the eigen decomposition of Σ_Y

$$\Sigma_Y - \lambda I = 0 \quad 0 = I \lambda - \sqrt{3}$$

$$\begin{vmatrix} 2-\lambda & 1 \\ 1 & 2-\lambda \end{vmatrix} = 0$$

$$(2-\lambda)^2 - 1 = 0$$

$$(2-\lambda)^2 = 1$$

$$\lambda = 1, 3$$

$$(A - \lambda_i) v_i = 0$$

$$\lambda_1 = 1 \quad \begin{bmatrix} 1 & 1 \\ 1 & 1 \end{bmatrix} \begin{bmatrix} v_{11} \\ v_{12} \end{bmatrix} = 0$$

$$v_{11} + v_{12} = 0 \quad v_1 = -v_2$$

$$\therefore v_1 = \begin{bmatrix} 1 \\ -1 \end{bmatrix}$$

$$\lambda_2 = 3 \begin{bmatrix} -1 & 1 \\ 1 & -1 \end{bmatrix} \begin{bmatrix} V_{21} \\ V_{22} \end{bmatrix} = 0$$

$$-V_{21} + V_{22} = 0 \quad V_{21} = V_{22}$$

$$\therefore V_2 = \begin{bmatrix} 1 \\ 1 \end{bmatrix}$$

\therefore The matrix Σ_y has eigen values 1, 3 corresponding to eigenvectors $\begin{bmatrix} 1 \\ -1 \end{bmatrix}, \begin{bmatrix} 1 \\ 1 \end{bmatrix}$

Σ_y can be written as:

$$\Sigma_y = V \Lambda V^{-1}$$

$$\text{where } V = \begin{bmatrix} 1 & 1 \\ V_1 & V_2 \\ 1 & 1 \end{bmatrix}$$

V is a matrix whose columns give the eigenvectors of Σ_y

$$\Lambda = \begin{bmatrix} \lambda_1 & 0 \\ 0 & \lambda_2 \end{bmatrix}$$

Λ is a diagonal matrix whose elements are eigenvalues of Σ_y

$$\Sigma_y = V \Lambda V^{-1}$$

$$= A \cdot A^T$$

$$\therefore A = V \Lambda^{1/2} V^{-1}$$

$$= \begin{bmatrix} 1 & 1 \\ -1 & 1 \end{bmatrix} \begin{bmatrix} \sqrt{\lambda_1} & 0 \\ 0 & \sqrt{\lambda_2} \end{bmatrix} \begin{bmatrix} 1/2 & -1/2 \\ 1/2 & 1/2 \end{bmatrix}$$

$$A = \begin{bmatrix} 1.366 & 0.366 \\ 0.366 & 1.366 \end{bmatrix}$$

c)

Scatter plot of 5000 standard 2D Gaussian samples

Scatter plot of 5000 transformed 2D Gaussian samples

The results from parts (c)(i) and (ii) are in line with the theoretical findings. The plot of (c)(ii) represents a 2D transformed gaussian quite effectively. Similarly, the A matrix calculated from the transformed samples matches with its hand-calculated counterpart.

Exercise 3:

a) Scatter plot of data

b)

Exercise 3

$$b) \hat{\beta} = \underset{\beta}{\operatorname{argmin}} \|y - X\beta\|^2,$$

y is the column vector whose elements are given using the following equation

$$y = \begin{bmatrix} y_1 \\ y_2 \\ \vdots \\ y_n \end{bmatrix} \quad y_n = \beta_0 + \beta_1 L_1(x_n) + \beta_2 L_2(x_n) \\ + \beta_3 L_3(x_n) + \beta_4 L_4(x_n) + \epsilon$$

$L_p(x_n)$ is the p^{th} legendre polynomial
 ϵ is the noise term

$$x_n = \begin{bmatrix} x_1 \\ x_2 \\ \vdots \\ x_n \end{bmatrix} \quad x \text{ is a vector of 50 equidistant points in the interval } [-1, 1]$$

$$\beta = \begin{bmatrix} \beta_0 \\ \beta_1 \\ \beta_2 \\ \beta_3 \\ \beta_4 \end{bmatrix} \quad \beta \text{ is a column vector consisting of multiplicative coefficients}$$

$$\beta = \begin{bmatrix} -0.001 \\ 0.01 \\ 0.55x \\ 1.5 \end{bmatrix}$$

8. ~~matrix~~

~~standardizing~~ ~~113 values~~ ~~matrix~~ ~~with~~ ~~0~~ ~~1~~
~~values~~ ~~parallel~~ ~~and~~ ~~ones~~ ~~using~~ ~~0~~ ~~1~~

X is the data matrix whose i^{th} row
 is given by the i^{th} Legendre polynomial
 calculated over x

$$= + (\text{row}) + I + \text{E} +$$

$$X = \begin{bmatrix} L_0(x_1) & L_1(x_1) & \dots & L_4(x_1) \\ L_0(x_2) & L_1(x_2) & \dots & L_4(x_2) \\ \vdots & \vdots & \ddots & \vdots \\ L_0(x_{50}) & L_1(x_{50}) & \dots & L_4(x_{50}) \end{bmatrix}$$

50×5

The training loss for this linear regression problem is given by:

$$E_{\text{train}}(\beta) = \|y - X\beta\|^2$$

taking the gradient with respect to β

$$\begin{aligned}\nabla_{\beta} E_{\text{train}}(\beta) &= \nabla_{\beta} \left\{ \|y - X\beta\|^2 \right\} \\ &= -2X^T(y - X\beta)\end{aligned}$$

equating it to zero,

$$X^T(y - X\beta) = 0$$

$$\begin{aligned}X^T X \beta &= X^T y \\ \therefore \beta &= (X^T X)^{-1} X^T y\end{aligned}$$

c) Least squares solution

d) Presence of Outliers

Observation: The existence of outliers has severely impacted the performance of Least Square regression. The fitted curve has experienced a positive offset, and no longer is representative of the data.

e) Linear Programming Problem

e) We consider the following optimization

$$\hat{\beta} = \underset{\beta}{\operatorname{argmin}} \|y - X\beta\|_1$$

$$\underset{\beta \in \mathbb{R}^5}{\operatorname{minimize}} \sum_{n=1}^{50} |y_n - x_n^\top \beta|$$

we denote $u_n = |y_n - x_n^\top \beta|$

The problem becomes

$$\underset{\beta \in \mathbb{R}^5, u \in \mathbb{R}^{50}}{\operatorname{minimize}} \sum_{n=1}^{50} u_n$$

subject to $u_n = |y_n - x_n^\top \beta|$

The expression $u_n = |y_n - x_n^\top \beta|$

can be written as:

$$u_n \geq -(y_n - x_n^\top \beta) \quad \& \quad u_n \geq (y_n - x_n^\top \beta)$$

We can convert this into a linear programming problem:

We can define U_n as

$$\sum_{n=1}^N U_n = \sum_{p=0}^4 (0)(B_p) + \sum_{n=1}^{50} (1)(U_n)$$

$$= \begin{bmatrix} 0 \dots 0 & 1 \dots 1 \end{bmatrix}_{1 \times (55)} \begin{bmatrix} B \\ U \end{bmatrix}$$

$U_n \geq - (y_n - x_n^\top \beta)$ can be written as
 $x_n^\top \beta - U_n \leq y_n$

$$\begin{bmatrix} x_1^\top & -1 & 0 & \dots & 0 \\ x_2^\top & 0 & -1 & \dots & 0 \\ \vdots & & & & \\ x_{50}^\top & 0 & 0 & \dots & -1 \end{bmatrix} \begin{bmatrix} \beta \\ U_1 \\ \vdots \\ U_{50} \end{bmatrix} \leq \begin{bmatrix} y_1 \\ y_2 \\ \vdots \\ y_{50} \end{bmatrix}$$

$$\begin{bmatrix} X - I \\ 0 \end{bmatrix} \begin{bmatrix} \beta \\ U \end{bmatrix} \leq y$$

Similarly constraint $U_n \geq y_n - x_n^\top \beta$
can be written as
 $-x_n^\top \beta - U_n \leq -y_n$

$$\begin{bmatrix} -X - I \\ 0 \end{bmatrix} \begin{bmatrix} \beta \\ U \end{bmatrix} \leq -y$$

∴ Our problem can now be defined as

$$\text{minimize } \begin{bmatrix} 0_5 \\ I_{50} \end{bmatrix} \begin{bmatrix} \beta \\ u \end{bmatrix}$$

$$\text{subject to } \begin{bmatrix} X & -I \\ -X & -I \end{bmatrix} \begin{bmatrix} \beta \\ u \end{bmatrix} \leq \begin{bmatrix} y \\ -y \end{bmatrix}$$

It is of the form:

$$\underset{x}{\text{minimize}} \quad c^T x$$

$$\text{subject to } Ax \leq b$$

$$c = \begin{bmatrix} 0_5 \\ I_{50} \end{bmatrix} \quad x = \begin{bmatrix} \beta \\ u \end{bmatrix}$$

$$A = \begin{bmatrix} X & -I \\ -X & -I \end{bmatrix} \quad b = \begin{bmatrix} y \\ -y \end{bmatrix}$$

Conditional Generative Adversarial Networks

Parth Sagar Hasabnis, Master of Science in ECE¹

Abstract

This document provides a basic paper template and submission guidelines. Abstracts must be a single paragraph, ideally between 4–6 sentences long. Gross violations will trigger corrections at the camera-ready phase.

- Do not alter the style template; in particular, do not compress the paper format by reducing the vertical spaces.
- Keep your abstract brief and self-contained, one paragraph and roughly 4–6 sentences. Gross violations will require correction at the camera-ready phase. The title should have content words capitalized.

1. Electronic Submission

Submission to ICML 2021 will be entirely electronic, via a web site (not email). Information about the submission process and L^AT_EX templates are available on the conference web site at:

<http://icml.cc/>

The guidelines below will be enforced for initial submissions and camera-ready copies. Here is a brief summary:

- Submissions must be in PDF.
- Submitted papers can be up to eight pages long, not including references, plus unlimited space for references. Accepted papers can be up to nine pages long, not including references, to allow authors to address reviewer comments. Any paper exceeding this length will automatically be rejected.
- **Do not include author information or acknowledgements** in your initial submission.
- Your paper should be in **10 point Times font**.
- Make sure your PDF file only uses Type-1 fonts.
- Place figure captions *under* the figure (and omit titles from inside the graphic file itself). Place table captions *over* the table.
- References must include page numbers whenever possible and be as complete as possible. Place multiple citations in chronological order.

1.1. Submitting Papers

Paper Deadline: The deadline for paper submission that is advertised on the conference website is strict. If your full, anonymized, submission does not reach us on time, it will not be considered for publication.

Anonymous Submission: ICML uses double-blind review: no identifying author information may appear on the title page or in the paper itself. Section 2.3 gives further details.

Simultaneous Submission: ICML will not accept any paper which, at the time of submission, is under review for another conference or has already been published. This policy also applies to papers that overlap substantially in technical content with conference papers under review or previously published. ICML submissions must not be submitted to other conferences and journals during ICML's review period. Informal publications, such as technical reports or papers in workshop proceedings which do not appear in print, do not fall under these restrictions.

Authors must provide their manuscripts in **PDF** format. Furthermore, please make sure that files contain only embedded Type-1 fonts (e.g., using the program `pdffonts` in linux or using `File/DocumentProperties/FONTs` in Acrobat). Other fonts (like Type-3) might come from graphics files imported into the document.

Authors using **Word** must convert their document to PDF. Most of the latest versions of Word have the facility to do this automatically. Submissions will not be accepted in Word format or any format other than PDF. Really. We're not joking. Don't send Word.

Those who use **L^AT_EX** should avoid including Type-3 fonts. Those using `latex` and `dvi` may need the following two commands:

```
dvips -Ppdf -tletter -G0 -o paper.ps paper.dvi
```

¹Anonymous Institution, Anonymous City, Anonymous Region, Anonymous Country. Correspondence to: Anonymous Author <anon.email@domain.com>.

055 ps2pdf paper.ps

056
057 It is a zero following the “-G”, which tells dvips to use the
058 config.pdf file. Newer TeX distributions don’t always need
059 this option.

060 Using pdflatex rather than latex, often gives better
061 results. This program avoids the Type-3 font problem, and
062 supports more advanced features in the microtype pack-
063 age.

064
065 **Graphics files** should be a reasonable size, and included
066 from an appropriate format. Use vector formats (.eps/.pdf)
067 for plots, lossless bitmap formats (.png) for raster graphics
068 with sharp lines, and jpeg for photo-like images.

069 The style file uses the hyperref package to make click-
070 able links in documents. If this causes problems for you,
071 add nohyperref as one of the options to the icml2021
072 usepackage statement.

073 1.2. Submitting Final Camera-Ready Copy

074 The final versions of papers accepted for publication should
075 follow the same format and naming convention as initial
076 submissions, except that author information (names and af-
077 filiations) should be given. See Section 2.3.2 for formatting
078 instructions.

079 The footnote, “Preliminary work. Under review by the
080 International Conference on Machine Learning (ICML).
081 Do not distribute.” must be modified to “Proceedings of
082 the 38th International Conference on Machine Learning,
083 Online, PMLR 139, 2021. Copyright 2021 by the author(s).”

084 For those using the LATEX style file, this change (and
085 others) is handled automatically by simply changing
086 \usepackage{icml2021} to

087 \usepackage[accepted]{icml2021}

088 Authors using Word must edit the footnote on the first page
089 of the document themselves.

090 Camera-ready copies should have the title of the paper as
091 running head on each page except the first one. The running
092 title consists of a single line centered above a horizontal rule
093 which is 1 point thick. The running head should be centered,
094 bold and in 9 point type. The rule should be 10 points
095 above the main text. For those using the LATEX style file, the
096 original title is automatically set as running head using the
097 fancyhdr package which is included in the ICML 2021
098 style file package. In case that the original title exceeds the
099 size restrictions, a shorter form can be supplied by using
100 \icmltitlerunning{...}

101 just before \begin{document}. Authors using Word must
102 edit the header of the document themselves.

2. Format of the Paper

All submissions must follow the specified format.

2.1. Dimensions

The text of the paper should be formatted in two columns, with an overall width of 6.75 inches, height of 9.0 inches, and 0.25 inches between the columns. The left margin should be 0.75 inches and the top margin 1.0 inch (2.54 cm). The right and bottom margins will depend on whether you print on US letter or A4 paper, but all final versions must be produced for US letter size.

The paper body should be set in 10 point type with a vertical spacing of 11 points. Please use Times typeface throughout the text.

2.2. Title

The paper title should be set in 14 point bold type and centered between two horizontal rules that are 1 point thick, with 1.0 inch between the top rule and the top edge of the page. Capitalize the first letter of content words and put the rest of the title in lower case.

2.3. Author Information for Submission

ICML uses double-blind review, so author information must not appear. If you are using LATEX and the icml2021.sty file, use \icmlauthor{...} to specify authors and \icmlaffiliation{...} to specify affiliations. (Read the TeX code used to produce this document for an example usage.) The author information will not be printed unless accepted is passed as an argument to the style file. Submissions that include the author information will not be reviewed.

2.3.1. SELF-CITATIONS

If you are citing published papers for which you are an author, refer to yourself in the third person. In particular, do not use phrases that reveal your identity (e.g., “in previous work (?), we have shown ...”).

Do not anonymize citations in the reference section. The only exception are manuscripts that are not yet published (e.g., under submission). If you choose to refer to such unpublished manuscripts (?), anonymized copies have to be submitted as Supplementary Material via CMT. However, keep in mind that an ICML paper should be self contained and should contain sufficient detail for the reviewers to evaluate the work. In particular, reviewers are not required to look at the Supplementary Material when writing their review.

2.3.2. CAMERA-READY AUTHOR INFORMATION

If a paper is accepted, a final camera-ready copy must be prepared. For camera-ready papers, author information should start 0.3 inches below the bottom rule surrounding the title. The authors' names should appear in 10 point bold type, in a row, separated by white space, and centered. Author names should not be broken across lines. Unbolded superscripted numbers, starting 1, should be used to refer to affiliations.

Affiliations should be numbered in the order of appearance. A single footnote block of text should be used to list all the affiliations. (Academic affiliations should list Department, University, City, State/Region, Country. Similarly for industrial affiliations.)

Each distinct affiliations should be listed once. If an author has multiple affiliations, multiple superscripts should be placed after the name, separated by thin spaces. If the authors would like to highlight equal contribution by multiple first authors, those authors should have an asterisk placed after their name in superscript, and the term “*Equal contribution” should be placed in the footnote block ahead of the list of affiliations. A list of corresponding authors and their emails (in the format Full Name <email@domain.com>) can follow the list of affiliations. Ideally only one or two names should be listed.

A sample file with author names is included in the ICML2021 style file package. Turn on the [accepted] option to the stylefile to see the names rendered. All of the guidelines above are implemented by the L^AT_EX style file.

2.4. Abstract

The paper abstract should begin in the left column, 0.4 inches below the final address. The heading ‘Abstract’ should be centered, bold, and in 11 point type. The abstract body should use 10 point type, with a vertical spacing of 11 points, and should be indented 0.25 inches more than normal on left-hand and right-hand margins. Insert 0.4 inches of blank space after the body. Keep your abstract brief and self-contained, limiting it to one paragraph and roughly 4–6 sentences. Gross violations will require correction at the camera-ready phase.

2.5. Partitioning the Text

You should organize your paper into sections and paragraphs to help readers place a structure on the material and understand its contributions.

2.5.1. SECTIONS AND SUBSECTIONS

Section headings should be numbered, flush left, and set in 11 pt bold type with the content words capitalized. Leave

0.25 inches of space before the heading and 0.15 inches after the heading.

Similarly, subsection headings should be numbered, flush left, and set in 10 pt bold type with the content words capitalized. Leave 0.2 inches of space before the heading and 0.13 inches afterward.

Finally, subsubsection headings should be numbered, flush left, and set in 10 pt small caps with the content words capitalized. Leave 0.18 inches of space before the heading and 0.1 inches after the heading.

Please use no more than three levels of headings.

2.5.2. PARAGRAPHS AND FOOTNOTES

Within each section or subsection, you should further partition the paper into paragraphs. Do not indent the first line of a given paragraph, but insert a blank line between succeeding ones.

You can use footnotes¹ to provide readers with additional information about a topic without interrupting the flow of the paper. Indicate footnotes with a number in the text where the point is most relevant. Place the footnote in 9 point type at the bottom of the column in which it appears. Precede the first footnote in a column with a horizontal rule of 0.8 inches.²

2.6. Figures

You may want to include figures in the paper to illustrate your approach and results. Such artwork should be centered, legible, and separated from the text. Lines should be dark and at least 0.5 points thick for purposes of reproduction, and text should not appear on a gray background.

Label all distinct components of each figure. If the figure takes the form of a graph, then give a name for each axis and include a legend that briefly describes each curve. Do not include a title inside the figure; instead, the caption should serve this function.

Number figures sequentially, placing the figure number and caption *after* the graphics, with at least 0.1 inches of space before the caption and 0.1 inches after it, as in Figure 1. The figure caption should be set in 9 point type and centered unless it runs two or more lines, in which case it should be flush left. You may float figures to the top or bottom of a column, and you may set wide figures across both columns (use the environment `figure*` in L^AT_EX). Always place two-column figures at the top or bottom of the page.

¹Footnotes should be complete sentences.

²Multiple footnotes can appear in each column, in the same order as they appear in the text, but spread them across columns and pages if possible.

Figure 1. Historical locations and number of accepted papers for International Machine Learning Conferences (ICML 1993 – ICML 2008) and International Workshops on Machine Learning (ML 1988 – ML 1992). At the time this figure was produced, the number of accepted papers for ICML 2008 was unknown and instead estimated.

Algorithm 1 Bubble Sort

```

Input: data  $x_i$ , size  $m$ 
repeat
    Initialize  $noChange = true$ .
    for  $i = 1$  to  $m - 1$  do
        if  $x_i > x_{i+1}$  then
            Swap  $x_i$  and  $x_{i+1}$ 
             $noChange = false$ 
        end if
    end for
    until  $noChange$  is  $true$ 

```

2.7. Algorithms

If you are using L^AT_EX, please use the “algorithm” and “algorithmic” environments to format pseudocode. These require the corresponding stylefiles, algorithm.sty and algorithmic.sty, which are supplied with this package. Algorithm 1 shows an example.

2.8. Tables

You may also want to include tables that summarize material. Like figures, these should be centered, legible, and numbered consecutively. However, place the title *above* the table with at least 0.1 inches of space before the title and the same after it, as in Table 1. The table title should be set in 9 point type and centered unless it runs two or more lines, in which case it should be flush left.

Table 1. Classification accuracies for naive Bayes and flexible Bayes on various data sets.

DATA SET	NAIVE	FLEXIBLE	BETTER?
BREAST	95.9 ± 0.2	96.7 ± 0.2	✓
CLEVELAND	83.3 ± 0.6	80.0 ± 0.6	✗
GLASS2	61.9 ± 1.4	83.8 ± 0.7	✓
CREDIT	74.8 ± 0.5	78.3 ± 0.6	
HORSE	73.3 ± 0.9	69.7 ± 1.0	✗
META	67.1 ± 0.6	76.5 ± 0.5	✓
PIMA	75.1 ± 0.6	73.9 ± 0.5	
VEHICLE	44.9 ± 0.6	61.5 ± 0.4	✓

Tables contain textual material, whereas figures contain graphical material. Specify the contents of each row and column in the table’s topmost row. Again, you may float tables to a column’s top or bottom, and set wide tables across both columns. Place two-column tables at the top or bottom of the page.

2.9. Citations and References

Please use APA reference format regardless of your formatter or word processor. If you rely on the L^AT_EX bibliographic facility, use natbib.sty and icml2021.bst included in the style-file package to obtain this format.

Citations within the text should include the authors’ last names and year. If the authors’ names are included in the sentence, place only the year in parentheses, for example when referencing Arthur Samuel’s pioneering work (?). Otherwise place the entire reference in parentheses with the authors and year separated by a comma (?). List multiple references separated by semicolons (???). Use the ‘et al.’ construct only for citations with three or more authors or after listing all authors to a publication in an earlier reference (?).

Authors should cite their own work in the third person in the initial version of their paper submitted for blind review. Please refer to Section 2.3 for detailed instructions on how to cite your own papers.

Use an unnumbered first-level section heading for the references, and use a hanging indent style, with the first line of the reference flush against the left margin and subsequent lines indented by 10 points. The references at the end of this document give examples for journal articles (?), conference publications (?), book chapters (?), books (?), edited volumes (?), technical reports (?), and dissertations (?).

Alphabetize references by the surnames of the first authors, with single author entries preceding multiple author entries. Order references for the same authors by year of publication, with the earliest first. Make sure that each reference includes all relevant information (e.g., page numbers).

220 Please put some effort into making references complete,
221 presentable, and consistent. If using bibtex, please pro-
222 tect capital letters of names and abbreviations in titles, for
223 example, use {B}ayesian or {L}ipschitz in your .bib file.
224

225 Software and Data 226

227 If a paper is accepted, we strongly encourage the publica-
228 tion of software and data with the camera-ready version
229 of the paper whenever appropriate. This can be done by
230 including a URL in the camera-ready copy. However, **do**
231 **not** include URLs that reveal your institution or identity in
232 your submission for review. Instead, provide an anonymous
233 URL or upload the material as “Supplementary Material”
234 into the CMT reviewing system. Note that reviewers are not
235 required to look at this material when writing their review.
236

237 Acknowledgements 238

239 **Do not** include acknowledgements in the initial version of
240 the paper submitted for blind review.

241 If a paper is accepted, the final camera-ready version can
242 (and probably should) include acknowledgements. In this
243 case, please place such acknowledgements in an unnum-
244 bered section at the end of the paper. Typically, this will
245 include thanks to reviewers who gave useful comments,
246 to colleagues who contributed to the ideas, and to fund-
247 ing agencies and corporate sponsors that provided financial
248 support.
249

250 A. Do *not* have an appendix here 251

252 **Do not put content after the references.** Put anything that
253 you might normally include after the references in a separate
254 supplementary file.
255

256 We recommend that you build supplementary material in
257 a separate document. If you must create one PDF and cut
258 it up, please be careful to use a tool that doesn’t alter the
259 margins, and that doesn’t aggressively rewrite the PDF file.
260 pdftk usually works fine.

261 **Please do not use Apple’s preview to cut off supplemen-**
262 **tary material.** In previous years it has altered margins, and
263 created headaches at the camera-ready stage.
